Specialization: Data Science

Problem description

ABC is a pharmaceutical company that wants to understand the persistency of a drug as per the physician's prescription for a patient. The company has approached an Analytics company to automate this process of identification. This Analytics company has assigned the task to Team Primero to come up with a solution to automate the persistency of a drug for the client ABC.

Data Set

Bucket	Variable	Variable Description
Unique Row Id	Patient ID	Unique ID of each patient
Target Variable	Persistence_Flag	Flag indicating if a patient was persistent or not
Demographics	Age	Age of the patient during their therapy
	Race	Race of the patient from the patient table
	Region	Region of the patient from the patient table
	Ethnicity	Ethnicity of the patient from the patient table
	Gender	Gender of the patient from the patient table
Provider Attributes	IDN Indicator	Flag indicating patients mapped to IDN
	NTM - Physician Specialty	Specialty of the HCP that prescribed the NTM Rx
	NTM - T-Score	T Score of the patient at the time of the NTM Rx (within 2 years prior from rxdate)
	Change in T Score	Change in Tscore before starting with any therapy and after receiving therapy (Worsened, Remained Same, Improved, Unknown)
	NTM - Risk Segment	Risk Segment of the patient at the time of the NTM Rx (within 2 years days prior from rxdate)
Clinical Factors	Change in Risk Segment	Change in Risk Segment before starting with any therapy and after receiving therapy (Worsened, Remained Same, Improved, Unknown)
	NTM - Multiple Risk Factors	Flag indicating if patient falls under multiple risk category (having more than 1 risk) at the time of the NTM Rx (within 365 days prior from rxdate)
	NTM - DEXA Scan Frequency	Number of DEXA scans taken prior to the first NTM Rx date (within 365 days prior from rxdate)
	NTM - DEXA Scan Recency	Flag indicating the presence of DEXA Scan before the NTM Rx (within 2 years prior from rxdate or between their first Rx and Switched Rx; whichever is smaller and applicable)
	DEXA During Therapy	Flag indicating if the patient had a DEXA Scan during their first continuous therapy
	NTM - Fragility Fracture Recency	Flag indicating if the patient had a recent fragility fracture (within 365 days prior from rxdate)
	Fragility Fracture During Therapy	Flag indicating if the patient had fragility fracture during their first continuous therapy
	NTM - Glucocorticoid Recency	Flag indicating usage of Glucocorticoids (≥ 7.5 mg strength) in the one year look-back from the first NTM Rx
	Glucocorticoid Usage During Therapy	Flag indicating if the patient had a Glucocorticoid usage during the first continuous therapy
	NTM - Injectable Experience	Flag indicating any injectable drug usage in the recent 12 months before the NTM OP Rx
Disease/Treatment Factor	NTM - Risk Factors	Risk Factors that the patient is falling into. For chronic Risk Factors complete lookback to be applied and for non-chronic Risk Factors, one year lookback from the date of first OP Rx
	NTM - Comorbidity	Comorbidities are divided into two main categories - Acute and chronic, based on the ICD codes. For chronic disease we are taking complete look back from the first Rx date of NTM therapy and for acute diseases, time period before the NTM OP Rx with one year lookback has been applied
	NTM - Concomitancy	Concomitant drugs recorded prior to starting with a therapy (within 365 days prior from first rxdate)
	Adherence	Adherence for the therapies

Data Types

The dimension of the dataset is (3424, 69). The features have the following datatypes. (“object” types mean categorical columns):

PtId	object
Persistence_Flag	object
Gender	object
Race	object
Ethnicity	object
Region	object
Age_Bucket	object
Ntm_Speciality	object
Ntm_Specialist_Flag	object
Ntm_Speciality_Bucket	object
Glucn_Record_Prior_Ntm	object
Glucn_Record_During_Rx	object
Dexa_Frac_During_Rx	int64
Dexa_During_Rx	object
Frag_Frac_Prior_Ntm	object
Frag_Frac_During_Rx	object
Risk_Segment_Prior_Ntm	object
Tscore_Bucket_Prior_Ntm	object
Risk_Segment_During_Rx	object
Tscore_Bucket_During_Rx	object
Change_T_Score	object
Change_Risk_Segment	object
Adherent_Flag	object
Idn_Indicator	object
Injectable_Experience_During_Rx	object
Comorb_Encounter_For_Screening_For_Malignant_Neoplasms	object
Comorb_Encounter_For_Immunization	object
Comorb_Encntr_For_General_Exam_W_O_Complaint_Susp_Or_Reprtd_Dx	object
Comorb_Vitamin_D_Deficiency	object
Comorb_Other_Joint_Disorder_Not_Elsewhere_Classified	object
Comorb_Encntr_For_Oth_Sp_Exam_W_O_Complaint_Suspected_Or_Reprtd_Dx	object
Comorb_Long_Term_Current_Drug_Therapy	object
Comorb_Dorsalgia	object
Comorb_Personal_History_Of_Other_Diseases_And_Conditions	object
Comorb_Other_Disorders_Of_Bone_Density_And_Structure	object
Comorb_Disorders_of_lipoprotein_metabolism_and_other_lipidemias	object
Comorb_Osteoporosis_without_current_pathological_fracture	object
Comorb_Personal_history_of_malignant_neoplasm	object

Risk_Hysterectomy_Oophorectomy	object
Risk_Estrogen_Deficiency	object
Risk_Immobilization	object
Risk_Recurring_Falls	object
Count_OF_Risks	int64

Data Problems

- Null Values: The dataset has no Null values.
- Outliers: There are only two numerical columns, both of which have some outliers.
 1. count_of_risks:

2. dexa_freq_during_rx:

- Skewness and Kurtosis: There are only two numerical columns, both of which have some outliers.
 1. count_of_risks:
 - a. Count of risks skewness: 0.8797905232898707
 - b. Count of risks Kurtosis: 0.9004859968892842
 2. dexa_freq_during_rx:
 - a. dexa_freq_during_rx skewness: 6.8087302112992285
 - b. dexa_freq_during_rx Kurtosis: 74.75837754795428

Data Cleaning And Transformation

Since there are no Null values, so there is nothing to do in that regard. They are some skewness and Kurtosis in two numerical features, so we scaled their values by RobustScaler() and after that remove their outliers by calculating IQR and remove data smaller/greater than two whiskers. After removing outliers from “dexa_freq_during_rx”, we can now check the decrease in the shape of the data:

Old Shape: (3424, 69)

New Shape: (2964, 69)

All the ['Y', 'N'] values have been changed to [1, 0] to train models on the data, and also we have changed the values of target feature from ['Non-Persistent', 'Persistent'] to [0, 1].

The other problem in the data was the misbalancing of the target feature:

Since misbalanced datasets makes predicting hard and interfere with the models, we can do "Up sampling" on the data. In this method, we increase the records of the minority class such that at the end count of records is same for each class.

Another thing we performed on the dataset is “one hot encoding”. We need numerical values to use classifiers. This is done by using the “get_dummies()” function from Pandas library.

ID	Gender
1	Male
2	Female
3	Not Specified
4	Not Specified
5	Female

ID	Male	Female	Not Specified
1	1	0	0
2	0	1	0
3	0	0	1
4	0	0	1
5	0	1	0

Data Dependency

Final Recommendation

Moving forward, now we can perform classifiers models on the train set. The whole dataset is split into train and test sets (70% for train set and 30% test set).
